

Journyx

Release 2025H2

Version 13.5.0

Accessing New Features

This guide includes descriptions of new features in Journyx and Journyx PX version 13.5.0 (2025H2) and is intended for existing Journyx customers who are upgrading to the 2025H2 release from Journyx 13.4.x (2025H1). If you are upgrading from an earlier version, you will also need the guides for earlier versions.

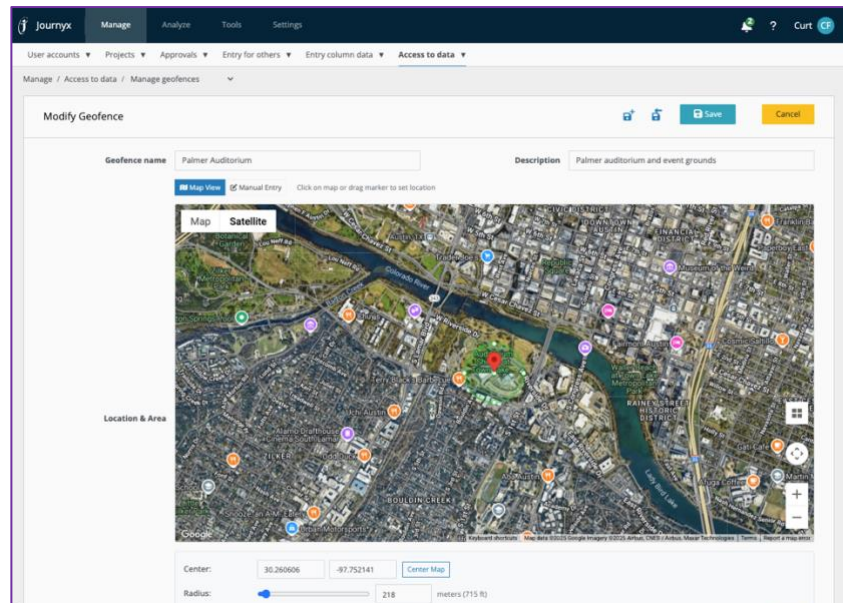

The 2025H2 release is only available for cloud customers right now. If you have additional questions about a feature, please contact your account representative or email [Journyx Support](mailto:info@journyx.com).

Optional Geofencing for Location-Based Entry Validation in the Field

In the 2025H2 release, Journyx has expanded the geolocation tracking capabilities to include entry validation options for confirming entry from specific locations or “fences”. You can now set up areas where users are required to be when logging time, expenses or custom data like equipment usage.

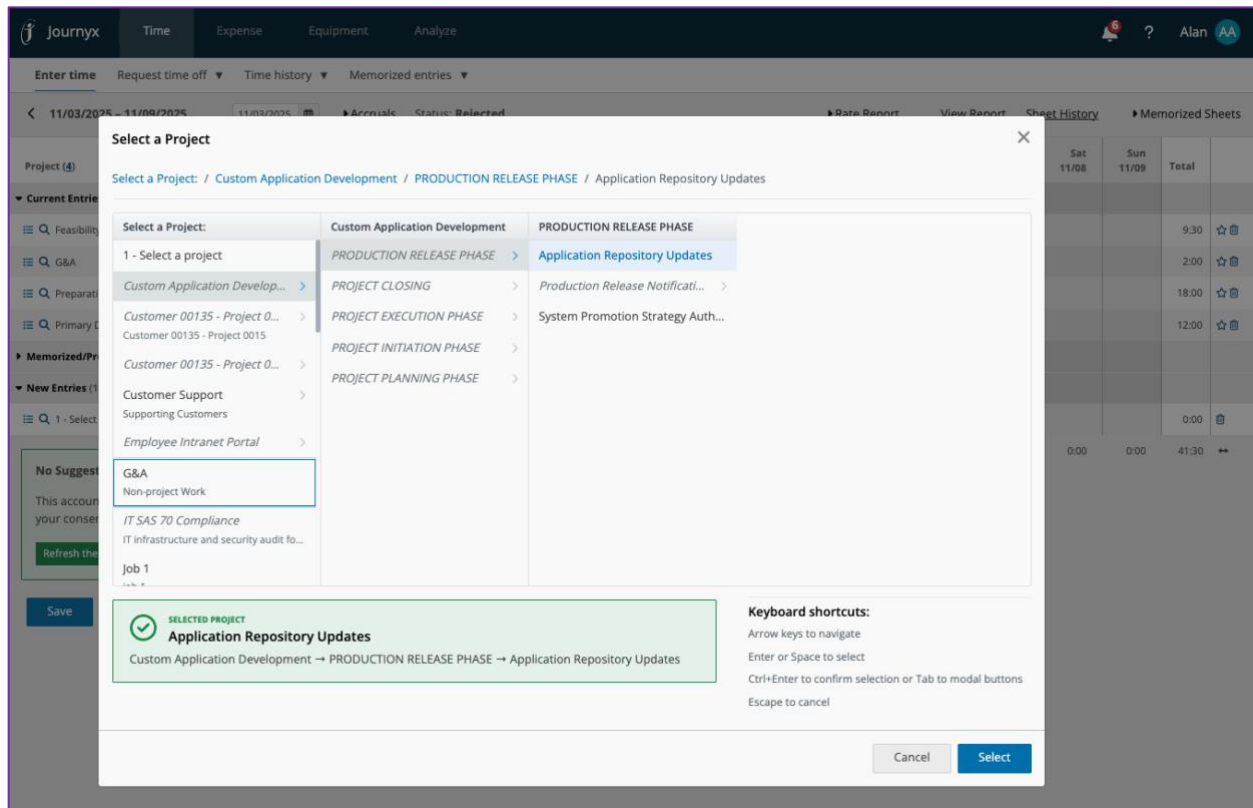

You can create and manage geofences here: **Manage→Access to data→Manage geofences**. The quick help on this screen explains the basic features of geofencing, how they interact with other settings (e.g., required location tracking), and brief examples of common use cases. You can put users into one or more geographic fences that are checked before the users can enter time (either hours or job start/stop). You can do this by assigning fences to individual users, groups and/or entry screen assignments. You can also set priority fences when items must be tracked in a specific fence (e.g., a project or job that can only be worked in one of the user’s valid fences).

If you missed the details on how to turn on location tracking and require location tracking for different entry methods, you can review the [Journyx JX 13.4/2025H1 upgrade guide](#) for more information.

Improved Project Hierarchy Selection on Entry Screens

The 2025H2 release also includes a new and improved project selection option on entry screens. The project tree icon to the left of the Project select list on time entry screens has been updated from an older expand/collapse paradigm to a richer horizontal panel with color and detail to make it easier to identify projects and tasks in a complex project hierarchy.

New REST API Support for Full Sheet Dataset

As part of the 2025H2 release, the Journyx REST API has been expanded cover most sheet operations. Over time, Journyx has been building out the REST API to eventually replace the classic SOAP-based jxAPI. With the inclusion of sheet operations, the most common use cases for pulling and pushing data through the API are now covered. REST API sheet handling also includes areas not covered by the classic API such as leave and punch/in/out data. You can review the tutorial for using the new APIs here: <https://docs.journyx.com/docs/tutorial/api-tutorial-entry-sheets>.

Journyx Mobile: Geofencing, Approver Summary by Project, Improved Biometric Sign In

New versions of the Journyx Mobile app are also available with the 2025H2 Journyx JX release. The apps include support for validating entry for geofence requirements. Users are blocked from entering time if they are required to be in one of their assigned fences and are not. The app informs them that they are

not in a location required for time entry. Approvers also have a new option to toggle from hours/amount totals by day to totals by project when approving submitted sheets. Lastly, Journyx has added an option to make logging back in to the app quicker when biometric sign in is enabled on a user's mobile device. You can allow your users to log back in quickly by going to **Settings→System settings→Security settings** and turning on this setting: *Allow mobile app users to choose to remember their biometric login info after tapping the Logout button.*

A number of bugs were also fixed in the 2025H2 release. You can view the complete [change list for the 2025H2 release here](#). If you would like additional training on the 2025H1 release or want your site assessed for optimization, please contact your account manager to discuss options we have available.
